About Tumblr OAuth

Tumblr supports [OAuth](#) 1.0a, accepting parameters via the Authorization header, with the HMAC-SHA1 signature method only. There's probably already an [OAuth client library](#) for your platform.

If you've worked with [Twitter's OAuth implementation](#), you'll feel right at home with ours.

Request-token URL:

POST http://www.tumblr.com/oauth/request_token

Authorize URL:

<http://www.tumblr.com/oauth/authorize>

Access-token URL:

POST http://www.tumblr.com/oauth/access_token

xAuth

Web apps should use the standard OAuth flow, reserving xAuth for apps in which the web authorization process is impractical or impossible, such as native desktop or mobile apps.

xAuth is not enabled by default. To request xAuth permission for your app, please use the *Request xAuth* link on an app above.

xAuth access-token URL:

POST https://www.tumblr.com/oauth/access_token

Accepts `x_auth_username` (the user's email address), `x_auth_password`, and `x_auth_mode=client_auth`, just like [Twitter's implementation](#).
